                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel HER-2 (herstatin-2) antagonist CD particularly a polypeptide that binds to the extracellular domain (ECD) CD of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8. The present CD invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product CD of the alternative transcript is a truncated HER-2 protein designated CD fine alternative transcript is a truncated HER-2 protein designated CD pl85HER-2 which lacks the transmembrane and intracellular domains of pl85HER-2 but contains ECD I, II of the pl85HER-2 and the novel ECDIIIa. CT he ECDIIIa contains ECD I, II of the pl85HER-2 and thus antagonise the HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify colid tumours. The present sequence is human p68HER-2 generic protein CC containing ECDIIIa variant sequence.

Note: The present sequence is not shown in the specification but is contend that the contend of the present sequence (SEQ ID NO:2) shown in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel HER-2 (herstatin-2) antagonist CC particularly a polypeptide that binds to the extracellular domain (ECD) CC of HER-2 at a site that is different from the binding site of humanised CC antibody, Herceptin, at an affinity of at least 10.8. The present CC invention is based upon the initial discovery of an alternative HER-2 CC mRNA transcript with 274 bp insert of intron 8. The translation product CC of the alternative transcript is a truncated HER-2 protein designated CC p68HER-2 which lacks the transmembrane and intracellular domains of CC p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. CC The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise CC the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the movel ECDIIIa variant sequence. Include acids encoding these are useful to treat, diagnose and identify C solid tumours. The present sequence is human p68HER-2 generic protein CC containing ECDIIIa variant sequence.

CC Note: The present sequence is not shown in the specification but is contained from p68HER-2 generic sequence (SEQ ID NO:2) shown in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody. Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated 968HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the

The present sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence.

Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the

                                                                                                                                                                                                                     The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody. Herceptin, at an affinity of at least 10~8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p8HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIA variant sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /label=
